

PowerSense AI — Electricity Bill Verification Guide

Practical RAG reference for FESCO/DISCO bill analysis | Built for uploaded electricity-bill images/PDFs

1. Read the bill

- Extract bill month, due date, previous reading, present/current reading, units, consumer category, reference/consumer number, and payable amounts when visible.
- Use OCR plus visual/manual verification for important numeric fields.

2. Check meter arithmetic

- Expected units = Present/Current Reading – Previous Reading.
- Compare the calculated units with the bill's printed units.
- If OCR conflicts with the visible bill or arithmetic, flag the field for verification instead of silently accepting the OCR value.

3. Check the payable amount

- Keep the bill's payable-within-due-date and after-due-date amounts separate.
- Do not infer a hidden surcharge or tax unless the bill or retrieved official source supports it.
- Break down only those charges that are actually visible or reliably extracted.

4. Consumption analysis

- Compare current units with previous-period information only when such information is available.
- A higher bill does not automatically mean an incorrect bill; consumption, tariff category, taxes, adjustments and other components can affect the total.
- Recommendations should focus on practical energy-use reduction rather than making unsupported billing allegations.

5. Complaint/attention logic

- Potential mismatch: readings and units do not reconcile.
- Potential missing evidence: important bill field is unreadable.
- Potential tariff question: charge needs confirmation against the applicable official tariff/notification.
- Potential complaint: user reports a dispute that remains unresolved after the appropriate distribution-company channel.

Example based on the uploaded FESCO bill used during development

- Previous reading: 19,756 (arithmetic consistency check).
- Present reading: 19,907.
- Units: 151.

- Check: $19,907 - 19,756 = 151$ units.
- Payable within due date shown: Rs. 3,470.
- After due date shown: Rs. 3,750.
- This arithmetic check supports the unit calculation, but it does not by itself prove that every tariff/charge on the bill is correct.

Safety rule for PowerSense

If evidence is incomplete, the correct output is 'Requires Verification' rather than a definitive accusation of fraud, illegal billing, or meter tampering.

PowerSense AI knowledge-base document. This is a concise source-backed reference prepared from official NEPRA material; it is not an original NEPRA publication.
